

### 8<sup>th</sup> Grade UNIT 11 OVERVIEW: Linear Functions – Equations of Lines

Unit Outcomes	Key Vocabulary
At the end of this unit, your student should be able to:	Terms to deepen the student's understanding
<ul style="list-style-type: none"> <li>✓ Recognize slope-intercept form of a line and define the slope and y-intercept</li> <li>✓ Graph a line given the equation, determine the slope of the line, and the y-intercept of the line</li> <li>✓ Use effective strategies for writing linear equations from verbal, numerical, or graphical information</li> <li>✓ Apply linear equations to real-world situations</li> </ul>	<ul style="list-style-type: none"> <li>✓ Horizontal</li> <li>✓ Linear Equation</li> <li>✓ Linear Function</li> <li>✓ Linear Relationship</li> <li>✓ Non-Linear Function</li> <li>✓ Proportional Relationship</li> <li>✓ Similar Triangles</li> <li>✓ Slope</li> <li>✓ Slope-Intercept Form</li> <li>✓ Standard Form of an Linear Equation</li> <li>✓ Unit Rate</li> <li>✓ Vertical</li> <li>✓ Vertical Line Test</li> <li>✓ x-intercept</li> <li>✓ x-intercept</li> <li>✓ y-intercept</li> <li>✓ y-value</li> </ul>
Key Standards Addressed	Where This Unit Fits
Connections to Common Core/NC Essential Standards	Connections to prior and future learning
<p>8.EE.5 - Graph proportional relationships, interpreting the unit rate as the slope of the graph. Compare two different proportional relationships represented in different ways. <i>For example, compare a distance-time graph to a distance-time equation to determine which of two moving objects has greater speed.</i></p> <p>8.EE.6 - Use similar triangles to explain why the slope <math>m</math> is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation <math>y = mx</math> for a line through the origin and the equation <math>y = mx + b</math> for a line intercepting the vertical axis at <math>b</math>.</p> <p>8.F.3 - Interpret the equation <math>y = mx + b</math> as defining a linear function, whose graph is a straight line; give examples of functions that are not linear.</p> <p>8.F.4 - Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two <math>(x, y)</math> values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or table of values.</p>	<p><b>Coming into this unit, students should have a strong foundation in:</b></p> <ul style="list-style-type: none"> <li>✓ Computing unit rates</li> <li>✓ Recognizing and representing proportional relationships between quantities</li> <li>✓ Identifying the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships</li> <li>✓ Representing proportional relationships with equations</li> <li>✓ Identifying relations and functions by graphs, tables/ordered pairs, and equations</li> <li>✓ Determining constant rate of change given a graph, table or equation.</li> <li>✓ Explaining how slope effects the graph of an equation in <math>y = mx</math> form</li> <li>✓ Finding slope from a graph and from any two points</li> </ul> <p><b>This unit builds to the following future skills and concepts:</b></p> <ul style="list-style-type: none"> <li>✓ Construct and interpret a linear function given a graph, verbal description, a table or a set of ordered pairs</li> <li>✓ Compare two different linear functions represented in different forms</li> <li>✓ Prove that linear functions grow by equal differences over equal intervals</li> </ul>
